

SeeGULL Multilingual

(Stereotype Generation Using LLMs)

Data Card Authors: Mukul Bhutani, Kevin Robinson, Shachi Dave, Vinodkumar Prabhakaran, Sunipa Dev

This dataset was created as part of the SeeGULL Multilingual project. It consists of tuples of the form (identity term, attribute) along with human annotations about whether the terms in the tuple are stereotypically associated, and how offensive they are.

This dataset has been created to aid evaluations of multilingual models for stereotypes with a very broad coverage of over 1,190 identity groups spanning 20 languages as used in 23 regions.

SENSITIVE HUMAN ATTRIBUTES	SOURCE(S) OF HUMAN ATTRIBUTES	RATIONALE FOR COLLECTING HUMAN ATTRIBUTES
Race Gender Ethnicity Socio-economic status Geography Language Sexual Orientation Religion Age Culture Disability Experience or Seniority Others (please specify)	[Geography]: Stereotypes present in the dataset are related to demonyms, and thereby to different regions across the world. However, the data does not relate to any specific individual's human attributes. [Culture]: Annotators were asked to label whether the attribute token of the tuple is commonly believed to be stereotypically associated with the identity term of the tuple. This annotation inherently and intentionally captures the view of the society or the culture.	We collect stereotypes associated with a person's geographical belonging, which is also inherently related to their culture. This helps create a benchmark with a broad coverage so systems and models deployed across the globe can be more rigorously evaluated.

Terms of Art

Concepts and Definitions referenced in this Data Card

Identity terms	Attribute Tokens (or tokens for short)
<p>Definition: These are words used to describe a group of people with a common trait or identity. In the context of this data we focus on identity terms that pertain to regional identity, specifically demonyms.</p> <p>For eg: Croatians is a term used to describe the people of Croatia, Hawaiians is a term used to describe people who are from the US state of Hawaii.</p>	<p>Definition: These are characteristics or attributes for which we aim to identify stereotypical associations. These span categories like profession, adjectives, socio-economic status, subjects of study and so on.</p> <p>For eg: doctor, teacher (profession), poor, powerful (socio-economic status), smart, handsome, ugly (adjectives), computer science, mathematics (subjects of study) and so on.</p>
Tuple	Stereotype/Stereotypical
<p>Definition: A combination of one identity term and one attribute token.</p> <p>For eg: (Hindu, Priest); (Punjabi, Dance) etc.</p>	<p>Definition: In social psychology, a stereotype is a generalized belief about a particular category of people. It is an expectation that people might have about every person of a particular group.</p> <p>Source: Wikipedia</p>

Reflections on Data

Limitations due to human annotation	Annotation about stereotypes and their prevalence in society is subjective. While we attempt to capture diversity in our annotator pool wrt gender and geographical region, we recognize that it still does not capture all different opinions and perspectives. Future iterations of such data collection should take more participatory approaches and involve communities with lived experiences on the harms of bias in society.
No ground truth on “Stereotype”	We recognize that there is no “ground-truth” on labeling something as a “Stereotype”. This is an inherently subjective opinion that is influenced by socio-cultural factors and personal experiences. Thus, we caution against using the data in this dataset to in any way classify tuples as “Stereotypical” vs “Non-stereotypical”.
Stereotypes not captured by this dataset	We generate candidate stereotypes using seeds which could influence what is generated. Our annotations are also limited by the availability of annotators of particular identities . This limits what gets annotated as a stereotype, and there exist stereotypes not captured by our dataset.
Caution against calling models “fair” based on evaluation on this dataset	This dataset is insufficient to capture all stereotypes associated with geographical and regional diversity across the globe. Additionally, our dataset reflects the judgements of a small number of annotators. Hence, they should be used only for diagnostic and research purposes, and not as benchmarks to prove lack of bias.
